

In the Claims:

1. (currently amended) Method for transmitting a plurality of information symbols between a first transceiver and a second transceiver by modulating a carrier signal,

wherein

a different modulation index (M1, M2, M3, M4) is assigned to each one of the information symbols, ~~[[and]]~~ the information symbols convey data, and the modulation indices convey additional information in addition to the data,

at least one characteristic physical variable of the carrier signal is modulated in accordance with the different modulation indices (M1, M2, M3, M4) assigned respectively to the information symbols that are modulated onto the carrier signal. signal to produce a modulated signal, and

the modulated signal is transmitted from the first transceiver to the second transceiver, and the second transceiver evaluates the modulated signal to obtain the data and the additional information.

2. (previously presented) Method according to claim 1, wherein, alongside the frequency and phase, the amplitude (A) is modulated as the characteristic physical variable of the carrier signal.

1 3. (original) Method according to claim 1, wherein the nth
2 information symbol is transmitted with a time-shift from
3 the (n+1)th information symbol.

Claim 4 (canceled).

1 5. (currently amended) Method according to claim 1, wherein
2 ~~the nth information symbol is transmitted simultaneously~~
3 ~~with the (n+x)th information symbol.~~ comprising
4 simultaneously transmitting a selected one (n) of the
5 information symbols and a subsequent one (n+x) of the
6 information symbols that follows the selected one of the
7 information symbols.

Claim 6 (canceled).

1 7. (currently amended) ~~Method according to claim 1, wherein~~
2 Method for transmitting a plurality of information symbols
3 between a first transceiver and a second transceiver by
4 modulating a carrier signal,
5 wherein
6 a different modulation index (M1, M2, M3, M4) is
7 assigned to each one of the information symbols,
8 at least one characteristic physical variable of the
9 carrier signal is modulated in accordance with the
10 different modulation indices (M1, M2, M3, M4) assigned
11 respectively to the information symbols that are modulated
12 onto the carrier signal, and

13 not only the modulation indices (M1, M2, M3, M4) but
14 also respective period lengths (T0, T1) of modulation
15 periods differ respectively from one another to define
16 additional information symbols.

Claims 8 and 9 (canceled).

1 10. (previously presented) Method according to claim 1, wherein
2 the first transceiver controls the second transceiver by at
3 least one control signal, being a clock signal assigned to
4 an information symbol.

Claims 11 and 12 (canceled).

1 13. (currently amended) ~~Method according to claim 1, wherein~~
2 Method for transmitting a plurality of information symbols
3 between a first transceiver and a second transceiver by
4 modulating a carrier signal,
5 wherein
6 a different modulation index (M1, M2, M3, M4) is
7 assigned to each one of the information symbols,
8 at least one characteristic physical variable of the
9 carrier signal is modulated in accordance with the
10 different modulation indices (M1, M2, M3, M4) assigned
11 respectively to the information symbols that are modulated
12 onto the carrier signal, and
13 at least one of the information symbols comprises a
14 control signal for setting a data rate for a data

15 transmission of the modulated carrier signal by the first
16 transceiver, and the modulation index of the control signal
17 is smaller than the modulation index of a data signal
18 formed by others of said information symbols.

1 14. (previously presented) Method according to claim 10,
2 wherein the second transceiver has no electronic circuit
3 for clock generation and is a passive transponder that uses
4 the clock signal for local clocking.

Claim 15 (canceled).

1 16. (currently amended) A method of producing and transmitting
2 a modulated information signal from a first device to a
3 second device, comprising the steps:
4 a) defining plural information symbols;
5 b) assigning plural different modulation indices
6 respectively individually to said information symbols,
7 wherein said modulation indices differ from one
8 another;
9 c) representing information items, which are to be
10 transmitted, with said information ~~symbols~~, symbols,
11 wherein said modulation indices respectively assigned
12 to said information symbols represent additional
13 information in addition to said information items;
14 d) modulating said information symbols onto a carrier
15 signal, comprising modulating a characteristic
16 physical parameter of said carrier signal in

17 accordance with said different modulation indices
18 respectively assigned to said information symbols, to
19 produce a modulated information signal; ~~[[and]]~~
20 e) transmitting said modulated information signal from
21 said first device to said second ~~device~~. device; and
22 f) in said second device, evaluating said modulated
23 information signal to obtain said information items
24 and said additional information.

1 17. (previously presented) The method according to claim 16,
2 wherein said information symbols include first and second
3 information symbols that differ from one another, and said
4 modulation indices include first and second modulation
5 indices that differ from one another and that are
6 respectively assigned to said first and second information
7 symbols.

1 18. (previously presented) The method according to claim 17,
2 wherein said information symbols further include a third
3 information symbol that differs from said first and second
4 information symbols, and said modulation indices further
5 include a third modulation index that differs from said
6 first and second modulation indices and that is assigned to
7 said third information symbol.

1 19. (previously presented) The method according to claim 18,
2 wherein said information symbols further include a fourth
3 information symbol that differs from said first, second and

4 third information symbols, and said modulation indices
5 further include a fourth modulation index that differs from
6 said first, second and third modulation indices and that is
7 assigned to said fourth information symbol.

1 20. (previously presented) The method according to claim 17,
2 wherein said first and second information symbols
3 respectively have different durations relative to one
4 another.

1 21. (previously presented) The method according to claim 17,
2 wherein said first and second information symbols
3 respectively have different numbers and/or different
4 patterns of modulation pulses relative to one another.

1 22. (currently amended) The method according to claim 16,
2 wherein said different modulation indices respectively have
3 predefined modulation index values that differ from one
4 another by predefined differences that can be detected and
5 differentiated between by said second device, ~~and further~~
6 ~~comprising detecting and decoding said information symbols~~
7 ~~and said modulation indices respectively assigned thereto~~
8 ~~as received in said modulated information signal in said~~
9 ~~second device.~~

1 23. (currently amended) The method according to claim 16,
2 wherein said information symbols respectively having said
3 different modulation indices assigned thereto respectively

4 represent different types of said information items that
5 are to be ~~transmitted.~~ transmitted, and said additional
6 information represented by said different modulation
7 indices respectively identifies said different types of
8 said information items.

1 24. (previously presented) The method according to claim 16,
2 wherein said characteristic physical parameter of said
3 carrier signal being modulated in said step d) comprises a
4 frequency or a phase of said carrier signal.

1 25. (previously presented) The method according to claim 16,
2 wherein said characteristic physical parameter of said
3 carrier signal being modulated in said step d) comprises an
4 amplitude of said carrier signal.

1 26. (previously presented) The method according to claim 25,
2 wherein said different modulation indices give rise to
3 respective different maximum amplitudes and a consistent
4 amplitude modulation swing of said respective information
5 symbols modulated in said modulated information signal.

1 27. (previously presented) The method according to claim 16,
2 wherein said information symbols are modulated in
3 succession respectively in successive time intervals one
4 after another in said modulated information signal.

1 28. (previously presented) The method according to claim 16,
2 further comprising defining an additional information
3 symbol and modulating said additional information symbol
4 onto said carrier wave simultaneously with at least a
5 selected one of said information symbols defined in said
6 step a) by superimposing said additional information symbol
7 thereon in said modulated information signal.

1 29. (currently amended) ~~The method according to claim 16,~~
2 A method of producing and transmitting a modulated
3 information signal from a first device to a second device,
4 comprising the steps:

5 a) defining plural information symbols;

6 b) assigning plural different modulation indices
7 respectively individually to said information symbols,
8 wherein said modulation indices differ from one
9 another;

10 c) representing information items, which are to be
11 transmitted, with said information symbols;

12 d) modulating said information symbols onto a carrier
13 signal, comprising modulating a characteristic
14 physical parameter of said carrier signal in
15 accordance with said different modulation indices
16 respectively assigned to said information symbols, to
17 produce a modulated information signal; and

18 e) transmitting said modulated information signal from
19 said first device to said second device;

20 wherein said step d) comprises modulating said
21 information symbols successively in respective successive
22 time intervals onto said carrier signal, with one or more
23 of said successive time intervals respectively defining
24 respective successive signal periods bounded between field
25 gaps in said modulated information signal, and

26 further comprising defining ~~additional~~ further
27 information symbols that are respectively assigned
28 respective ones of said signal periods having respective
29 different time durations and that represent ~~additional~~
30 further information in said signal periods having said
31 different time durations.

1 30. (previously presented) The method according to claim 16,
2 wherein at least one of said information symbols represents
3 a control signal, and further comprising receiving said
4 control signal in said modulated information signal in said
5 second device and controlling said second device
6 responsively to said control signal.

1 31. (previously presented) The method according to claim 30,
2 wherein said second device is a passive transponder that
3 does not include a local clocking signal generator circuit,
4 wherein said control signal is a clock signal, and said
5 controlling of said second device comprises controlling a
6 local clocking of said second device in response to said
7 clock signal.

1 **32.** (new) Method according to claim 1, wherein the additional
2 information identifies respective data types of the
3 respective data conveyed by the information symbols.
